

SYSTEM AND METHOD FOR RANKING OBJECTS HAVING MULTIPLE ATTRIBUTES

ABSTRACT OF THE DISCLOSURE

A system and method that introduces ordering on a set of criteria and ranks
5 alternatives having two or more attributes. More specifically, a system and method for
online trading over a networked system where buyers and sellers make one or more trade
deals on one or more products or services that have two or more attributes by using a
Request For Quote (RFQ) process on an electronic marketplace. The system and method
relates to decision under certainty. To provide the advantages presented by the system
10 and method, a weight generator process computes weights of object attributes by re-
engineering the ranks of the selected objects given by the user. The computing of the
attribute weights is performed by score inequality.
